

China leads in solar power generation technology

Overview

As of 2024, China was responsible for 64 percent of the world's utility-scale solar and wind construction, with 339 gigawatt hours of renewable energy infrastructure in the works, even though it only has around 17 percent of the planet's population. Global solar installations are breaking records again in 2025. In H1 2025, the world added 380 gigawatts (GW) of new solar capacity – a staggering 64% jump compared to the same period in 2024, when 232 GW came online. For. Last year, a viral drone video from China's Guizhou province revealed an entire mountain range blanketed in solar panels stretching to the horizon. A recent report highlights that the country's fossil fuel consumption has stabilized while its electricity needs are. China installed a record 315 GW (AC) of new solar capacity in 2025, lifting cumulative installed PV capacity to 1. But to end its continued dependence on fossil fuels, it must now move ahead with planned reforms to its national electricity system. By Isabel Hilton
