

# City distributed power station energy storage project

## Overview

---

The article delineates ten significant benefits of urban distributed energy storage systems, underscoring their pivotal role in enhancing energy reliability, reducing costs, and facilitating the integration of renewable energy sources. They store surplus renewable energy for when it's not windy or sunny, and maintain a balance between energy supply and demand. There has been a 90 percent drop in the cost of batteries over the last 15 years as new factories have come on line, resulting in significant growth in this sector. Distributed generation (DG) in the residential and commercial buildings sectors and in the industrial sector refers to onsite, behind-the-meter energy generation. DG often includes electricity from renewable energy systems such as solar photovoltaics (PV) and small wind turbines, as well as battery. As part of our Clean Energy Commitment and in support of New York State's Climate Leadership and Community Protection Act (Climate Act), we're dedicated to helping the state achieve its energy storage targets of 1,500 megawatts (MW) by 2025 and 6,000 MW by 2030. But your solar-and-battery system can do so much more! It can sync with other systems to provide a meaningful amount of electricity when our grid needs it most. It's called a Distributed Power Plant (DPP) -- also. Explore the key benefits of urban distributed energy storage systems for sustainability and efficiency. 1 NYC's Department of Citywide.
