

Cost-effectiveness of bidirectional charging for energy storage containers

Overview

This study evaluates the long-term environmental effects of a widespread deployment of bidirectional charging in the European energy supply sector using a prospective life cycle assessment (pLCA) approach. Battery Energy Storage Systems (BESS) are systems that use battery technology to store electrical energy for later use. Equipped with this technology, EVs can not only draw power from the grid but also return electricity to it, or supply power to homes during peak demand or in the event of blackouts. This paper introduces a novel testing environment that integrates unidirectional and bidirectional charging infrastructures into an existing hybrid energy storage. By analyzing customer groups and major use cases, two main situations can be identified: First, the electric vehicle is parked at home and effects from charging to the household installation behind the meter have to be considered: in the minimum scenario with any other unconventional consumers as. Abstract—This paper explores the potential of Vehicle-to-Everything (V2X) technology to enhance grid stability and support sustainable mobility in Dresden's Ostra district. By enabling electric vehicles to serve as mobile energy storage units, V2X offers grid stabilization and new business.

Cost-effectiveness of bidirectional charging for energy storage cont

Expanding Battery Energy Storage with Bidirectional Charging

By reducing infrastructure costs and improving energy efficiency, BDCs can help lower the overall cost of energy storage systems. This, in turn, can lead to increased adoption rates of ...
