

Data Centers Use Large-Capacity Mobile Energy Storage Containers from Asia

Overview

Driven by soaring demand for AI, cloud and advanced digital services, data centres across Asia Pacific are expanding rapidly - and so is their need for power. This is more than an energy challenge. Grid infrastructure needs to evolve, expanding and adapting to manage. battery storage solutions emerging as a key focus. To help industry professionals navigate these changes, ZincFive and Data Center Frontier have collaborated to produce this report, offering insights into the current landscape and future trends as predicted by their peers. Featuring contributions. Centralized cooling resources are of two types: (1) those moving chilled air through large ductwork; or (2) those moving chilled water in a piped cooling loop that exchanges heat with the environment. An alternative to these centralized systems is room-scale air conditioners. One type, called. Globally, data centers (excluding cryptocurrency mining) used an estimated 415 terawatt-hours (TWh) in 2024, about 1.5% of world electricity demand. This global demand has roughly doubled since 2010 (when usage was ~194 TWh) thanks to the explosion of digital services. The Center has studied Americans' attitudes toward and engagement with artificial intelligence, as well. The rise of artificial intelligence (AI) and other technologies has driven the “surging” growth of data centres in China, with associated increases in energy demand and emissions. There were 449 data centres in China at the end of 2023, the most in the Asia-Pacific region.
