Does liquid flow battery need antimony metal

Overview

By 2023, liquid metal batteries (LMBs) are likely to be competing with Li-ion, lead-acid and vanadium flow batteries for long duration stationery storage applications. Antimony is used in LMBs because when alloyed with other metals, e. lead, it makes the metals harder. Antimony is a chemical element that could find new life in the cathode of a liquid-metal battery design. An analysis by researchers at MIT has shown that energy storage would. Magnesium-antimony (Mg-Sb) liquid metal batteries have emerged as a particularly promising configuration within the broader LMB family. electrical grid as more renewable energy is added. Massive electrical storage must be created to compensate for the periods in which there is no wind. Ambri's Liquid Metal™ battery technology solves the world's biggest energy problems fundamentally changing the way power grids operate by increasing the contribution from renewable resources and reducing the need to build traditional power plants. The system operates at an elevated temperature maintained by self-heating during charging and discharging.
