

Energy storage for load shifting chile

Overview

Chile will need new renewable energy storage systems to replace its current backup capacity of coal-fired plants and natural gas-powered combined cycle turbines and improve the reliability of the country's electric grid as it pursues new renewable energy generation. Chile has emerged as a world leader in hybrid systems and standalone energy storage since implementing its Renewable Energy Storage and Electromobility Act in 2022. Ensuring projects are paid for injecting power into the grid during peak periods has supported growth, and ambitious battery energy. Against that backdrop, Grupo Ibereólica Renovables' decision to advance 1,330 MW of battery energy storage systems across its Chilean portfolio signals how developers are recalibrating project economics toward firmed renewable output rather than headline megawatts. Chile is leading the way in Latin America and has more projects in the pipeline, but hurdles remain Chilean president Gabriel Boric (centre) at the inauguration of an energy storage plant in the northern region of Antofagasta in April. Chile's renewable energy sector is facing significant operational challenges as the curtailment of solar photovoltaic (PV) and wind generation surpassed 6TWh in 2025, marking an ongoing increase in unused clean energy capacity. This issue highlights the growing tension between renewable generation.

Energy storage for load shifting chile

Chile makes progress on energy storage with 20+ approved projects

The technological diversity of energy storage projects in Chile is remarkable. From battery storage systems to innovative projects with gases such as CO2, the country is exploring different solutions to ...
