

# Energy storage systems walk-in and distributed

## Overview

---

This article explores the evolution of energy storage integration technology, from early centralized solutions to the latest distributed systems. Energy storage is a critical technology component to reducing our dependence on fossil fuels and building a low-carbon future. Without it, the shift to renewables will be impossible. Microgrids, net zero buildings, and local DERs are small modular energy generators that can provide an alternative to traditional large-scale generation. DES units are typically located on the distribution side of the grid or behind the meter at a customer's property. The strategic placement and appropriate sizing of these systems have the potential to significantly enhance the overall performance of the network.
