

Integrated solar power generation in high-rise residential buildings

Overview

This systematic review examined the use of building-integrated photovoltaics (BIPVs) in high-rise buildings, focusing on early-stage design strategies to enhance energy performance. As urban landscapes continue to grow vertically, integrating sustainable energy solutions like solar power into high-rise buildings has become both a necessity and a challenge. While solar energy offers significant environmental and financial benefits, implementing it in tall structures presents. Building-integrated photovoltaics is a set of emerging solar energy applications that replace conventional building materials with solar energy generating materials in the structure, like the roof, skylights, balustrades, awnings, facades, or windows. Unlike traditional solar panels mounted on rooftops, BIPV systems are incorporated into the building envelope—roofs, facades. Solar power generation for high-rise residential low-energy high-rise buildings with minimal GHG emissions.
