

# Is a solar system solar

## Overview

---

The Solar System is the gravitationally bound system of the Sun and the masses that orbit it, most prominently its eight planets, of which Earth is one. [11] The system formed about 4.6 billion years ago. The four inner terrestrial planets are Mercury, Venus, Earth, and Mars, all of which consist mainly of rock. 5 billion years ago when a cloud of interstellar gas and dust collapsed, resulting in a solar nebula, a swirling disc of material that collapsed to form the Sun. The solar system is far more than a collection of planets circling a star. It is a dynamic, evolving laboratory of cosmic history, stretching over 4.6 billion years. It contains everything from the Sun's blazing fusion furnace to icy bodies on the fringes of space, and it offers endless discovery. NASA's Voyager 1 and Voyager 2 are the only spacecraft leaving our solar system.

## Solar System Facts

Our planetary system is called "the solar system" because we use the word "solar" to describe things related to our star, after the Latin word for Sun, "solis."
