

# New photovoltaic panels for nighttime power generation

## Overview

---

Thanks to a new breakthrough, this is no longer a fantasy — scientists have created a photovoltaic (PV) cell that is able to generate power at night through a process known as radiative cooling. Rather than drawing power from the sun, the panel absorbs heat emanating from its own surface as. Thermoradiative energy generation, nicknamed night-time solar, produces electricity by emitting infrared radiation to the cold night sky when the device is warmer than its surroundings. Unlike conventional solar cells that absorb sunlight, thermoradiative devices emit photons to space, effectively. Stanford University researchers have introduced a revolutionary innovation in solar energy, solar panels that generate electricity at night. This innovation harnesses the Earth's infrared radiation to produce energy.
