

# Photovoltaic panel trial life

## Overview

---

Industry consensus and extensive testing show that solar panels typically last between 25 and 30 years before their efficiency drops below 80% of their original capacity. That's the real story behind solar panel lifespan. If you're counting on solar to deliver long-term savings, it pays to understand what "lasting 25 years" actually means, and what you can do to make every one of those years. Premium panels deliver superior long-term value: While premium panels with 0.25% degradation rates cost 10-20% more upfront, they produce 11.5% more electricity over 25 years compared to standard panels, often justifying the higher initial investment through extended productive life and better. High-accuracy public data on photovoltaic (PV) module degradation from the Department of Energy (DOE) Regional Test Centers will increase the accuracy and precision of degradation profiles calculated for representative PV hardware installed in the U.S. Its performance naturally declines over time, eventually rendering its "useful life" complete.
