

Photovoltaic panels that can withstand hail

Overview

High-quality, modern solar panels are extremely durable and designed to withstand most hail storms. The “Bridge”: The *real* risk isn't the panel, it's. Glass thickness is the critical protection factor: Research confirms that 4mm glass panels significantly outperform the standard 3.2mm thickness, with thicker glass successfully reducing or nullifying hail damage that destroys thinner alternatives. Real-world performance exceeds expectations: Solar panels are designed to withstand harsh weather conditions, like high winds and heavy rain – but what about frozen balls of hail falling from the sky?

Luckily, severe hail storms aren't super common around the country, and most solar panels can withstand light-to-moderate impact. Still, as homeowners from Colorado to Texas have learned, nature sometimes throws curveballs that even the toughest equipment can't dodge. Subscribe to the EnergySage Newsletter! Plug in for monthly energy-saving tips. Historically, solar photovoltaic PV modules have survived the majority of hail events they have experienced. In areas that have experienced very large hail (greater than 1 3/4" or 44 mm diameter), however, hail has caused significant damage to PV modules. Here's what makes them tough: Tempered Glass: The top layer is typically.
