

Photovoltaic panels under fire

Overview

Solar panel fires don't happen because photovoltaic technology is inherently dangerous – they occur when something goes wrong during installation or over time. Poor workmanship remains the leading culprit behind solar fires. When installers rush jobs or cut corners. While properly installed systems by qualified professionals must follow current safety codes, solar fires do happen. That's why the Solar Energy Technologies Office (SETO) funded the Solar Training and Education for Professionals (STEP) program, which provides tools to more than 10,000 firefighters. Some solar panels, for example, include a backing of highly combustible plastic. In laboratory-based fire tests of roof assemblies, 1, 2 the maximum allowable fire spread is between approximately 20 and 40 ft² (1. 7 m²), depending on whether an A, B or C rating is desired. In actual roof. Solar panels gleaming on rooftops have become a common sight across America, but a nagging question persists in many homeowners' minds: can these electrical systems actually catch fire?

The short answer is yes – but before you panic, the reality is far more reassuring than the fear. How often do. Whilst the risk of solar panel systems catching fire is extremely low, like any other technology that produces electricity, they can catch fire. In 2023, an article published by The Independent revealed that from January-July 2023, 66 fires relating to solar panels had occurred in the UK, compared. This research was conducted under the Investigation of Real Fires project, commissioned by the Department for Levelling Up, Housing and Communities (contract reference CPD/004/122/039), and subsequently transferred to the Health and Safety Executive in its role as the Building Safety Regulator. As such, firefighters need updated training that addresses the presence.
