

Planting *Bupleurum chinense* under photovoltaic panels

Overview

To provide insights, we compared agrophotovoltaic and traditional ecosystems to explore the economic feasibility of planting *Bupleurum chinense* (B. chinense) and *Medicago sativa* (M. sativa) from the perspectives of light utilization, photosynthetic responses, and land use. Whether you have a garden growing under your panels or overgrown trees surrounding your grid, controlling vegetation around your solar installations will prevent damage. The *bupleurum chinense* is planted in a greenhouse, and a transparent glass culture box is arranged at the top end of the greenhouse. First, choose sandy soil for land. For *Bupleurum chinense*, the watering amount should be sufficient to moisten the soil evenly, approximately 500 milliliters per session. This ensures that the plant's roots receive adequate moisture without becoming waterlogged.
