

# Sandbox model of wind and solar power generation

IP65/IP55 OUTDOOR CABINET

IP54/55

OUTDOOR ENERGY STORAGE CABINET

OUTDOOR MODULE CABINET

## Overview

---

To deal with the challenges of predicting solar and wind energy, including constant changes, complex patterns, and dependence on time-related factors, this study uses three well-known ML and Deep Learning (DL) models. These models are LSTM, XGBoost, and Random Forest (RF). Geographical Terrain Materials: To accurately represent the geographical environment of wind and solar power plants, materials such as foam boards, gypsum powder, and paint are commonly used. Foam boards are easy to cut and shape, allowing for quick construction of mountain and plain terrains. Large wind farm layout design; includes onshore and offshore wind power, booster stations, transmission lines, site environment, and. Forecasting renewable energy generation is crucial for improving the efficiency and reliability of power systems that integrate wind, solar, and other renewable sources. These energy sources are inherently variable, depending on changing weather patterns, which makes accurate forecasting a complex. This method is established based on a physical sandbox model, camera equipment and simulation technology. INTRODUCTION Need of energy plays an important role in human life.

## Sandbox model of wind and solar power generation

---

### Integration of wind flow effects in theoretical and experimental models

Unlike traditional solar models that solely rely on solar irradiance, this model considers the cooling effects of wind, offering a more accurate and region-specific prediction of solar
