

# Solar and coal-fired power stations

## Overview

---

Even as China's expansion of solar and wind power raced ahead in 2025, the Asian giant opened many more coal power plants than it had in recent years – raising concern about whether the world's largest emitter will reduce carbon emissions enough to limit climate change. 3 terawatts by the end of 2026 as China expects 300 GW to come from primarily wind and solar. China's installed solar power capacity is projected to surpass coal-fired capacity for the first time this year, marking a major. Coal-burning power plants, also known as coal-fired power stations, are facilities that generate electricity by burning coal, a fossil fuel.

## Solar and coal-fired power stations

### Wind and solar are booming in China. So why is it building

The massive growth in wind and solar begs the question: why is China still building coal power plants and, by most analyses, way more than it actually needs? The answer is complicated.
