

# Solar module curing effect

## Overview

---

Curing is a chemical process called cross-linking, where individual polymer chains bond together to form a stable, durable, and transparent sheet. In a solar module, layers of encapsulant (most commonly EVA or POE) surround the delicate solar cells. Additives like peroxides. A method for encapsulating solar cells includes a curing step that renders CIGS or other types of solar cell absorber layers resistant to degradation by high-temperature lamination processes. The finite element method was adopted to simulate the impacts of the rectangular solar panel encapsulation process parameters, such as the elastic. Lamp heating and hot air heating are the two principal methods for metal paste curing used in the manufacture of silicon heterojunction (SHJ) solar cells.
