

Solar power consumption demand curve

Overview

Duck curve is not only about energy shifting, but also the grid stability (frequency, ramping, and dispatch flexibility). The curve of the duck is a graph showing the irregular difference between the demand for electricity and the production of solar power over a typical day. Data is for the State of California on Octo(a Saturday), [1] a day when the wind power output was low and steady throughout the day. The orange curve rises steeply from 17:00 to 18:00 as the sun sets, requiring about 5 gigawatt of generating capacity from dispatchable sources to come. Energy Department research is taming the duck curve by helping utilities better balance energy supply and demand on the grid. If playback doesn't begin shortly, try restarting your device. An error occurred while retrieving sharing information. Learn about the duck curve and. As more solar capacity has come online in California, grid operators at the California Independent System Operator (CAISO) have observed a drop in net load (or the demand remaining after subtracting variable renewable generation) in the middle of the day when solar generation tends to be highest. Ember (2026); Energy Institute - Statistical Review of World Energy (2025) - with major processing by Our World in Data This dataset contains yearly electricity generation, capacity, emissions, imports and demand data for European countries.

Solar power consumption demand curve

To lower electric bills, consumers quietly install DIY solar

Plug-in solar has remained in the shadows because of a lack of safety standards and often costly requirements imposed by utilities, but that's changing.
