

# The effect of ultraviolet light on photovoltaic panels

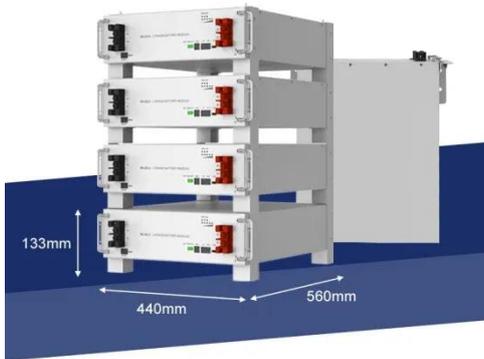

## Overview

---

We present here a literature review of the effects of prolonged UV exposure of PV modules, with a particular emphasis on UV exposure testing using artificial light sources, including fluorescent, Xenon, and metal halide lamps. A significant factor responsible for PV module degradation is exposure to the UV component of solar radiation. Understanding how solar panels interact with sunlight can help you grasp their efficiency and application in the broader solar industry. Paul Gebhardt, PV Module Degradation Analysis and Modeling at Fraunhofer Institute for Solar Energy Systems Image: Fraunhofer ISE Can you give some background on recent industry concerns around ultraviolet-induced. y about 4% of the sunlight's energy is from UV light. While PV panels are. The sun emits a spectrum of light, including visible light, infrared, and ultraviolet (UV) rays. While most people know UV light can cause sunburns, fewer realize it plays a unique role in the performance and longevity of photovoltaic cells —the building blocks of solar panels.

### Uncovering UV degradation risks in solar panels

We have UV-induced degradation, which as far as we know causes irreversible damage to the cell passivation layer. Then there is an additional process which happens after the UV test. ...

## Can Solar Panels Use Ultraviolet or Infrared Light?

Photons from infrared light don't have enough energy to knock electrons off and create electrical flow. And photons from ultraviolet light have too much energy--they can still create electrical flow, but a lot ...
