

# What does the shadow of the photovoltaic panel mean

## Overview

---

When a shadow falls on a panel, it blocks sunlight, preventing solar cells from producing electricity. Solar panels are made up of many individual cells, and these cells are usually connected in series. If a shadow was cast over half of a solar panel, then only half the amount of sunlight will be reaching the panel, and therefore the energy output of the solar panel will be halved, right?

Unfortunately, the physics is not so straightforward, and shadowing just a single cell in a solar panel could. When a shadow falls on a solar panel, its ability to generate electricity decreases. What causes the shadowing effect?

A reduction in power. This is because solar cells in a panel are connected in series, meaning the performance of each cell directly impacts the output of the others. According to Gilbert Masters, a former engineering professor at Stanford University and author of “Renewable Energy and Efficient Electric Power Systems,”. Your solar panels consist of photovoltaic cells (solar cells) combined into one module. If all photocells receive equal light, the panel operates at maximum efficiency.
