

What is the base station for network communication

Overview

A base station is a critical component of wireless communication networks. It serves as the central point of a network that connects various devices, such as smartphones, tablets, and computers. Base stations typically have a transceiver, capable of sending and receiving signals. Base stations are the foundational elements that make this connectivity possible, acting as fixed points that bridge the gap between a mobile device's radio signal and the global wired network. They are communication hubs in a cellular network that ensure continuous service as users move throughout. Base station (or base radio station, BS) is - according to the International Telecommunication Union's (ITU) Radio Regulations (RR) [1] - a "land station in the land mobile service. They provide the coverage you need for calls and data.

What is the base station for network communication

What is a base station?

A base station serves as a central connection point for a wireless ...
