

What s inside a base station lead-acid battery

Overview

Lead-acid batteries contain lead dioxide (PbO_2) positive plates, spongy lead (Pb) negative plates, and sulfuric acid (H_2SO_4) electrolyte. The casing is polypropylene for acid resistance. The electrolyte allows electric charge to move between the anode and cathode during battery use. These components enable. Inside these black boxes is a controlled storm of chemical reactions, designed to do one thing very well—store and deliver power, instantly and reliably. But what exactly is going on inside them?

Why are they still the top choice for so many applications?

And what makes lead acid battery. Lead batteries are so durable and reliable, we scarcely give a thought to what happens inside their solid cases. We take the lid off this technology, so to speak, and peer inside to.
