

# What to do if the photovoltaic panels heat evenly

## Overview

---

If solar energy systems become excessively hot, it may lead to decreased efficiency and increased wear on the components. Regularly check and maintain the system, 2. Ensure proper ventilation and airflow, 3. Consider installing shading devices. Counterintuitively, if the panels become too hot, they will actually produce less electricity. The efficiency of a solar panel is typically expressed as a percentage and. Overall, overheating compromises the long-term reliability and durability of solar panels. Panels that often reach high temperatures are more prone to wear. These localized areas of extreme heat occur when one or more cells in a panel become overheated, often due to shading, soiling, or internal defects.

## The Overheating of Solar Panels [photovoltaic, thermal, hybrid]

Photovoltaic solar panels do not bear the risk of overheating because they do not contain circulating water and they simply evacuate heat from each side of the panel.
