

# When solar power generation is not enough

## Overview

---

If your solar panel system isn't producing enough energy, it's essential to identify the cause and take appropriate action. Environmental factors cause 70% of solar production issues: Weather, shading, and dirt accumulation are the most common culprits behind reduced solar output, making regular monitoring and maintenance essential for optimal performance. 8% annually: Quality solar panels. While solar energy offers numerous advantages, including being renewable, abundant, and relatively clean, there are several reasons why it may not be sufficient to meet the world's growing energy demands. Let's explore some of the key variables influencing adoption of and demand for solar energy. Most of America and Canada are at elevated risk of blackouts and power outages in the next five to 10 years, according to the North American Electricity Reliability Corporation's 10-year outlook report. It is important to check for any visible issues, such as shading or dirt on the panels.
