

Zero injection solar

Overview

The function of zero injection, or a zero discharge inverter, is to modulate the operation of the solar panel so that it does not generate more energy than is required. However, due to the need to maintain grid quality, not all countries or electricity companies can allow generators to export to the grid, so the need to. HYXiPOWER, a world-leading provider of renewable energy solutions, announced the launch of its revolutionary “Zero Injection without Meter/CT All-in-One Residential ESS Series” at Solar Solution-Amsterdam 2025, one of the premier clean energy events in Europe. For this reason, KACO new energy inverters can be configured for zero feed-in. You can thus make sure that 100% of the solar energy produced is used locally and not fed into the public. This report presents the concept of a behind-the-meter solar garden, which is a utility scale solar photovoltaic plant located on the distribution side of a transmission to distribution transformer.

Zero injection solar

Solutions for zero feed-in and dynamic power regulation

There are instances when operators of solar PV systems are not allowed to feed solar energy into the public grid. For this reason, KACO new energy inverters can be configured for zero feed-in.

Power limitation and zero export

Solar panels are directly connected to the grid through inverters; the energy produced is transmitted to the site for self-consumption or is returned to the grid. However, in some countries, ...
